STATIC SHIFT is an arcade style game where the player will control a maintenance robot inside an abandoned research facility. The goal is to collect five energy cells to restore power while avoiding a security drone. There will be three actors involved: a player-controlled robot, collectible energy cells, and the moving security drone. Players will use the arrow keys to move around the facility and earn a point for each energy cell that is collected. The player will start with three lives, you lose one when you are hit by the drone, if you lose all three lives, game over. If you collect all five energy cells you win. There will be sound effects when you collect an energy cell and when you take damage.

The robot is the main character, the player character. The robot will use a default image in Greenfoot hopefully something that looks robotic. The robot's main objective is to collect energy cells while avoiding the security drone. If the robot touches an energy cell, it collects it and increases the player's score. If the robot collides with the security drone, the player will lose one of their three lives.

The energy cell is the collectible item and main objective. They are scattered through the facility. They too will be represented by an image from the Greenfoot library, preferably something that looks like a battery. There will be 5 of these energy cells placed around the game world when the game begins. When the player touches an energy cell, it will disappear from the screen, play a sound effect, and increase the player score. Once all five of these energy cells have been collected, the player will win the game and a victory message will appear on the screen.

The security drone is the main obstacle of the game, that the player will have to avoid to survive and win. This will use a default image from the Greenfoot library, hopefully something drone looking. The drone will automatically move back and forth across the facility, which creates an obstacle for the player. If the robot collides with this drone, the player will lose a life and a sound effect will play. The robot will return to it's starting position and give the player another

chance (unless they are all out of lives). If the player loses all three lives to the drone before collecting the 5 energy cells/batteries, the game will end and display a game over message on the screen.
