Static Shift is a game where you play as a robot inside a research facility. The facility has lost power and your job is to collect the five batteries before the drone hits you three times. The game itself is a side-scroller, with the ability to jump as well. You spawn in with three lives and zero points. Each time you are hit by the drone you lose a life, once all three have been lost it is game over. Your highest score will be display (the total batteries collected.) If you collect all five batteries before losing all three lives you win the game.

The Robot is the main player character. I will use a robot image from Greenfoot to represent this character. You will be able to move left to right, right to left, and you will be able to jump as well. The main objective here is simply to collect all five batteries before getting caught by the security drone three times. Now if the robot is hit, it will return to it's starting position as long as there are remaining lives. If you are hit a third time it's simply a game over.

The batteries are the item you need to collect and the win condition. There are gonna be five of them placed around the facility and some might require use of jumping to obtain. I will use a battery image from Greenfoot unless I can't find one for one reason or another. When the player (Robot) touches the battery it will disappear and play a sound effect, and one point will be added to the player's score. One all five batteries have been collected the game will end and display a "You Win" message. If the player doesn't collect all five batteries, their score will simply just be what the highest amount of batteries collected are, (1 or 3 etc.)

Now the security drone is the enemy of the game you are trying to avoid. It is the main obstacle and the final of the three objects/characters in the game. I will use a default Greenfoot image of a drone or something similar. It will move back and forth on it's own regardless of user input. The player will have to avoid it by jumping over it or moving out of the way. If the drone touches the player, the

player loses a life and a sound effect will play. The robot will return to where it started unless that was the last of three lives. If the player losers all three lives to the drone before collecting the five batteries, the game will end and display a Game Over message.
